5.3a Factoring Trinomials of the form $x^{2}+b x+c$

What Trinomial is represented by these algebra tiles?

$$
\begin{gathered}
(x+4)(x+2)=x^{2}+6 x+8 \\
(x+3)(x+5)=x^{2}+8 x+15 \\
3+5 \quad 3 \times 5
\end{gathered}
$$

Tiles placed along the top side and left side, represent the factors: $\qquad$ $x+2$ and $\qquad$ $x+4$ .

We can check our conclusion by multiplying the two binomials.

$$
(x+2)(x+4)=x^{2}+4 x+2 x+8
$$

Thus, the trinomial $\qquad$ $x^{2}+6 x+8$ is a product of $\qquad$ $x+2$ and $\qquad$ $x+4$ .

Model the trinomials $x^{2}+5 x+6$ and $x^{2}+3 x+2$ with algebra tiles. What are the binomial factors that multiply to give each as a product?
$x^{2}+5 x+6$

$$
x^{2}+3 x+2
$$

$$
x^{2}+5 x+6=(x+2)(x+3)
$$

We can also factor without the use of manipulatives. When trinomial are of the form $x^{2}+b x+c$, a pattern forms between the $b$ term and the $c$ term.

| Trinomial | Binomial Factor | Binomial Factor |
| :--- | :--- | :--- |
| $x^{2}+5 x+6$ | $x+3$ | $x+2$ |
| $x^{2}+8 x+12$ | $x+2$ | $x+6$ |
| $x^{2}+3 x y-18 y^{2}$ | $x+6 y$ | $x-3 y$ |
| $x^{2}+4 x+6$ | Cannot be factored |  |

What patterns do you notice in the table above?
the constant term is the product
" $x$ "term is the sum
We can factor by listing the factors of the $c$ term and then choosing the two which ADD to give the $b$ term.

Factor: $\quad x^{2}+11 x+24$ Factors of 24:

$$
\begin{array}{cccc}
-8 x-3 & -6 x-4 & -24 \times-1 & -12 x-2 \\
8 \times 3 & 6 \times 4 & 24 \times 1 & 12 \times 2 \\
\hline
\end{array}
$$

Two factors that add/ subtract to +11 : $\qquad$ 8 and $\qquad$ 3

$$
(x+8)(x+3)=x^{2}+11 x+24
$$

$$
x^{2}-10 x+24=(x-6)(x-4)
$$

REMEMBER! Always look for a GCF first!

$$
\begin{aligned}
4 x^{2}+12 x+8= & 4\left(x^{2}+3 x+2\right) \\
& 4(x+2)(x+1)
\end{aligned}
$$
